Abhijeet Bhowmick

BigQuery Cost Optimization & Data Automation Consultant

Mumbai, India | bhowmick2021@gmail.com | linkedin.com/in/abhijeetbhowmick

I help teams control BigQuery costs and automate recurring data work. Start with a scoped review that identifies the main cost drivers, prioritizes practical fixes, and defines what is worth implementing.

AI-assisted delivery using GPT and Claude, with personal ownership of technical decisions, validation, and handover.

19+ years in technology, data, and BI, including platform ownership at Directi/Radix and a 15–30% normalized BigQuery cost reduction there.

THREE OFFERS

Scope, duration and price are agreed after confirming your environment and access.

1. BigQuery Cost & Performance Review

- **Problem:** spend is climbing, ownership is unclear, and it is not obvious which changes matter most.
- **Deliverables:** prioritized cost drivers; proposed query, table and schedule changes; expected benefit with stated assumptions (estimated from your workload); implementation scope. Optional follow-on: an agreed optimization sprint.

2. Data Workflow Automation Sprint

- **Problem:** a repeated reporting, reconciliation or data-preparation task consumes recurring hours.
- **Deliverables:** one agreed workflow (Python, n8n, APIs, AI assistance where suitable) with exception handling, operating instructions and handover; outcome measure (hours, turnaround or errors) set at scope time. Optional follow-on: further workflows or maintenance.

3. Analytics Platform Health Check

- **Problem:** a lean data team has fragile BigQuery/Tableau reporting, duplicated logic or unclear dependencies.
- **Deliverables:** focused assessment, priority reliability and dependency issues, practical remediation plan. Optional follow-on: bounded stabilization or part-time governance support.

RELEVANT INTERNAL CASE EXAMPLES

- **BigQuery cost governance (internal, Radix):** owned BigQuery cost governance end to end; 15–30% normalized BigQuery cost reduction (Aug 2025–Jan 2026) from query tuning, workload governance and itemized fixes.
- **Slow Tableau extracts (internal, Radix):** approximately 95% reduction in runtime for one Tableau extract view in a benchmark (BigQuery vs a secondary reporting database). Relevant to a Health Check; benefit depends on workload.
- **Governance tooling, AI-assisted (internal, Radix):** Query Doctor estimates BigQuery query cost before it runs; Atlas shows lineage, ownership and health (pilot); Governance Hub scans daily. Built with GPT and Claude; I owned the problem, architecture, validation and rollout.
- **Platform migration (internal, Radix):** on-premises BI moved to BigQuery with no production disruption; relevant to an assessment of what to migrate and how to protect continuity.

HOW I WORK

Diagnose first, agree a focused written scope, deliver improvements the team can maintain, and hand over documentation. I do the work myself; GPT and Claude assist with analysis, code and documentation, and I validate every output before handover. Selective fixed-scope and part-time engagements; hours and overlap are set per engagement.

NEXT STEP

One next step: email me the main issue (BigQuery spend, a slow reporting workload, or a recurring manual data process). I will reply with whether a review or an implementation sprint is the right start. bhowmick2021@gmail.com | linkedin.com/in/abhijeetbhowmick
